

GUHRING

REAMERS, COUNTERSINKS
DE-BURRING TOOLS
COMPLETE RANGE

HR 500 HIGH-PERFORMANCE REAMERS

Perfect reaming in all diameters

HR 500 high-performance reamers are the optimal tooling solution for all diameters from 2.97 to 76.00 mm.

To apply the optimally designed HR 500 high-performance reamer a range of various HR 500 options is available.

- Solid carbide reamers up to diameter 20.00 mm
- Carbide and cermet-tipped reamers up to diameter 40.00 mm
- Carbide and cermet-tipped head reamers up to diameter 76.00 mm
- Solid carbide reamers for intermediate dimensions and stepped tools in HR 500 Active programme

Maximum performance for all materials

Our comprehensive HR 500 range includes reamers for the machining of most materials. The perfect combination of special geometries, tool material and coatings provides optimal machining results for all reaming operations.

DE-BURRING TOOLS

Hole entries and exits

- quick, clean and fully automated

Guhring provides a comprehensive standard range of de-burring tools for the finish machining of hole entry, hole exit and transverse hole exit – including the world's first solid carbide tools for the machine de-burring of hole entry and exit.

Instead of a time and cost-intensive manual operation, de-burring in a fully automated operating process reduces the machining time.

HOLDERS FOR FINISH MACHINING

Accuracy is a matter of setting

In order to achieve the best possible results with our precision reaming tools, they are clamped in Guhring holders for finish machining.

- Quick and simple adjustment
- Axial and radial μ -accurate setting
- Compensates concentricity and alignment errors
- MQL capable

Oberflächenqualität

Umrechnungsverhältnisse nach DIN 47

Beispiel 1 R_a in R_z

Beim Vergleich des Mittenrauwertes $R_a = 0,4 \mu\text{m}$ zur mittleren Rauhtiefe R_z , liegt diese bei $R_z = 1,6$.

Beispiel 2 R_z in R_a

Beim Vergleich der gemittelten Rauhtiefe $R_z = 25 \mu\text{m}$ zum Mittenrauhwert R_a , beträgt dieser $R_a = 1,5 \mu\text{m}$.

INFO TABLES AT A GLANCE

Surface Quality

Conversion ratio to DIN 47

Example 1: R_a in R_z

When comparing the average roughness index $R_a = 0.4 \mu\text{m}$ to the average roughness R_z we achieve a value of $R_z = 1.6 \mu\text{m}$.

Example 2: R_z in R_a

When comparing the average roughness $R_z = 25 \mu\text{m}$ to the average roughness index R_a we achieve a value of $R_a = 2 \mu\text{m}$.

ORDERING OPTIONS

When ordering please always state

Guhring no. and Code no., i.e.:

“Carbide high-performance reamers,
for nom.-Ø 2.97 mm” = **1675 2.970**

Guhring no.

High-performance reamers

The solid carbide HPC reamer HR 500 S operates with highest cutting rates and produces extremely high-quality holes. Therefore, it often enables considerable savings in the process costs. In addition, it provides very high process reliability.

High-performance reamers

The solid carbide HPC reamer HR 500 D operates with highest cutting rates (see Guhringguide) and produces extremely high-quality holes. Therefore, it often enables considerable savings in the process costs. In addition, it provides very high process reliability. The special coolant supply with flutes in the shank ensures optimal chip evacuation and reliable cooling.

High-performance reamers

The solid carbide HPC reamer HR 500 D operates with highest cutting rates (see Guhringguide) and produces extremely high-quality holes. Therefore, it often enables considerable savings in the process costs. In addition, it provides very high process reliability. The special coolant supply with flutes in the shank ensures optimal chip evacuation and reliable cooling.

High-performance reamers CAST

The HR 500 CAST reamer produces surface qualities that until now where not possible with multi-flute reamers. With quality casting finishes in GG up to $< Ra\ 1.6$ can be achieved without a problem, this naturally with the same high cutting rates. Diameter fluctuations are a thing of the past with this tool guaranteeing process reliability and a reduction in process costs. Also in GGG surface qualities of $< RA\ 1.2$ are not a problem thanks to the "Signum"-coating.

High-performance reamers ALU

The solid carbide HR 500 ALU high-performance reamer operates with highest cutting rates and produces excellent hole qualities. Thanks to the Carbo-coating the development of built-up edges is prevented. Subsequently, there is minimum diameter fluctuation and optimal surface quality of the reamed hole.

High-performance reamers

The carbide- or cermet-tipped HR 500 G S produces first-class hole qualities with highest cutting rates. In addition, it provides a very high process reliability and considerably reduces process costs.

Further advantages:

- Intermediate dimensions from Ø 20.1 mm can be supplied at short notice
- Carbide-tipped tools with “Signum”-coating for GG machining meeting highest demands on surface quality of hole (cutting rates see Guhring no. 1036/1037)
- Carbide-tipped tools with “Carbo”-coating for the machining of aluminium (cutting rates see Guhring no. 1678/1679)

HR 500 GT high-performance reamers top performance above Ø 40.00 mm

Also for diameters above 40.00 mm Guhring's HR 500 technology is first choice for high-performance reaming. Numerous intelligent solutions ensure also with large diameters maximum cutting rates and optimal quality:

Variety for perfect machining results

The HR 500 GT tool heads are available in the semi-standard range with short delivery times in the diameter range > 40.00 to 76.00 mm for the following material specific ranges:

- Carbide-tipped with nanoA-coating for stainless steels, GGG 60, GG, special alloys and non-ferrous metals
- Carbide-tipped with Signum-coating for GG
- Carbide-tipped with Carbo-coating for Al machining
- Cermet-tipped for steels and GGG 40/50

In addition, we manufacture special tools to customer specific requirements on request.

Optimal cooling lubrication

Thanks to the newly developed, patent applied for, re-direction screw at the face side of the HR 500 GT tool heads, the cooling lubricant process reliably reaches the cutting edges. It is impossible for chips to clog up the cooling lubricant exits. Thanks to the especially flat design of the re-direction screw the machining of blind holes is possible right up to the base of the hole.

If necessary, the re-direction screw can be removed for the machining of blind holes.

High-performance reamers

HR 500 GT as semi-standard

Straight shank ~ DIN 6535 HA tol. H6 with tang for optimal holding in extra length, slender hydraulic chuck Guhring no. 4290, but also in conventional hydraulic chucks or shrink fit chucks.

Further advantages:

- Intermediate dimensions from Ø 40 mm can be supplied at short notice
- Carbide-tipped tools with "Signum"-coating for GG machining meeting highest demands on surface quality of hole (cutting rates see Guhring no. 1036/1037)
- Carbide-tipped tools with "Carbo"-coating for the machining of aluminium (cutting rates see Guhring no. 1678/1679)

When applying long hydraulic chucks with tang: Eliminate play between chuck and reamer by rotating to stop prior to clamping.

Minimum order quantity is 2.

NC machine reamers

Ø > 3.75 mm with extremely unequal flute spacing
Tolerance for Guhring no. 1427:
≤ Ø 5.50 mm: 0.000/+0.004
> Ø 5.50 mm: 0.000/+0.005

NC machine chucking reamers similar to DIN 8093 with straight shank (h6) for standardised tool clamping in hydraulic or shrink fit chucks offer highest concentricity and process reliability for the production of holes to required tolerances.

NC machine reamers

Technical drawing of a shaft-hub assembly. The drawing shows a shaft of diameter d_1 inserted into a hub of diameter d_2 . The total length of the assembly is l_1 . The length of the shaft that is inserted into the hub is l_2 . The length of the shaft that protrudes from the hub is l_4 .

Solid carbide

Carbide reamers

Availability

The image shows a 10x10 grid with alternating light gray and dark gray horizontal bands. The bands are 2 rows high each, starting with a light gray band at the top. Black dots are placed at various intersections. A single white dot with a black outline is located at the intersection of the 5th column and the 7th row.

with carbide inserts
with int. centres on both ends

Expanding machine reamers similar to DIN 8050 have an adjustment range of approx. 0.03 mm via tapered screw setting.
Attention: Only expand reamer! Because of risk of breakage the pre-tension should never be relieved by turning the set screw anti-clockwise!

NC machine reamers

DIN
212-3

≤ Ø 3.75 mm with external centres on both ends
> Ø 3.75 mm with internal centres on both ends
Tolerance for Guhring no. 455:
≤ Ø 5.50 mm: 0.000/+0.004
> Ø 5.50 mm: 0.000/+0.005

The combination of NC machine chucking reamer and hydraulic, high precision clamping or shrink fit chuck respectively offers highest concentricity and process reliability for the production of holes to required tolerances. NC machine chucking reamers are similar to DIN 212 with straight shank (h6) for standardised tool clamping in hydraulic or shrink fit chucks. Short delivery for intermediate sizes.

NC machine reamers

DIN
212-3

≤ Ø 3.75 mm with external centres on both ends
> Ø 3.75 mm with internal centres on both ends
Tolerance for Guhring no. 455:
≤ Ø 5.50 mm: 0.000/+0.004
> Ø 5.50 mm: 0.000/+0.005

The combination of NC machine chucking reamer and hydraulic, high precision clamping or shrink fit chuck respectively offers highest concentricity and process reliability for the production of holes to required tolerances. NC machine chucking reamers are similar to DIN 212 with straight shank (h6) for standardised tool clamping in hydraulic or shrink fit chucks. Short delivery for intermediate sizes.

Adjustable hand reamers

HSS

DIN
859

Cyl

with square to DIN 10
with internal centres on both ends

The hand reamers are ground to nom. size and not for hole tolerance zone H7.
The adjustment range is 1/100 of the nom. diameter, i. e. for Ø 10.00 mm approx. 0.1 mm.
From Ø 6.50 mm the adjustment is via a lock nut.

GUHRING

Adjustable hand reamers

HSS

DIN
859

Cyl

left hand spiral flutes
with square to DIN 10
with internal centres on both ends

The hand reamers are ground to nom. size and not for hole tolerance zone H7.
The adjustment range is 1/100 of the nom. diameter, i. e. for Ø 10.00 mm approx. 0.1 mm.
From Ø 6.50 mm the adjustment is via a lock nut.

Pilot tools

PILOT TOOLS

This high-performance tooling system is both suitable for various machining tasks and a wide variety of materials.

The features:

- Highly precise, special shaped pocket seat for excellent insert guidance
- Precision-ground insert
- Radial screw for μm -accurate adjustment
- Easy adjustment while inserts are clamped
- Easy handling
- Large range of adjustment

Advantages in the use of these tools:

Easy adjustment while inserts are clamped...

Simply adjusting to desired bore tolerance reduces unproductive handling operations

The second cutting edge is embedded in the pocket seat

Avoids destruction of the second cutting edge by evacuated chips

Low costs in stock inventory due to large diameter coverage of tools

Low capital requirement

Example: Correcting off-set

min. 5.0 mm

With deep holes, deeper pilot drilling maybe necessary.

Off-set of pilot hole to reamer position
Correction with milling cutter or Hollfelder fine machining tool.

Ø 10 H7

The reamer follows the pilot setting and corrects the positioning error.

Additional design features:

The adjustable pilot tools with tapered screw have a robust clamping element located in the chip flute, large chip flutes and an internal coolant supply. These aforementioned design elements are responsible for an excellent chip evacuation even when long-chipping material is machined.

Based on our standard tools we also design and manufacture customer specific solutions for your individual machining requirements.

The radial fine adjustment with radial screw

Adjustment instruction

1. Changing the insert

Disassembly

- Loosen clamping set (1 to 2 turns) and remove the worn insert
- Clean the insert pocket
- Turn out the adjustment element 1 to 2 turns

Assembly

- Put a new insert in the pocket seat
- Press insert into the pocket seat, keep under pressure and slightly tighten the clamp set:
Torx 5 to 40 Ncm Torx 6 to 40 Ncm
Torx 8 to 100-120 Ncm Torx 15 to 250-300 Ncm

2. Adjustment of the inserts

- Clamp the holder in the presetting device
- Adjust the insert in diameter up to 0.05 mm smaller than target measure
- Tighten the clamp set

We recommend to use our torque wrench:

E 5000 adjustable	20-120 Ncm	E 5001 adjustable	100-600 Ncm
E 5400-5 fixed for Tx 5	45 Ncm	E 5400-6 fixed for Tx 6	70 Ncm
E 5400-8 fixed for Tx 8	140 Ncm	E 5400-15 fixed for Tx 15	345 Ncm

- Adjust insert to the required machining diameter (It is not necessary to retighten the clamping set!)

Torque for clamping elements

Tool body Series	Clamping set	Torque (Ncm)	Torx size
H 1035	E 1100	45	Tx 5
H 2850	E 1085 / E 1112	70	Tx 6
H 3570	E 1060	140	Tx 8
H 4090	E 1040	345	Tx 15

The cutting data recommendations in the table are guide values

and depend to a high degree on the stability of the machine, fixture and workpiece.

PCD reaming tools

In addition to our special cermet, carbide and HSS-E reamers we also supply diamond tipped reaming tools designed as a modular system for the pre- and finish machining of valve seats.

MODULE TECHNOLOGY AND ADVANTAGES

Pinpoint accurate tool setting. Thanks to closely arranged setting screws for radial and axial adjustment corrections can be made in close proximity to the measuring point. With a wide choice of chucks (hydraulic, shrink fit or HPC) and interfaces such as HSK and SK your module can be perfectly set without a problem.

Advantages:

- wobble-free tool setting
- quick μ -accurate setting
- optimal setting results for multi-flute PCD/CBN fine machining tools or Guhring's HR 500 high-performance reamer
- reduced settlement properties provides highest accuracy over a long period
- suitable for use in combination with monolythic special tools

Module 6x6 ISO taper alignment adapter

Product information

- ISO taper to DIN 69871-1 form AD/B
- for the highly accurate alignment of all modular flanges 6x6
- cooling lubricant without loss and flow-disruption thanks to the use of an intermediate tube
- suitable for MQL and conventional cooling
- balancing quality G6.3 / 15,000 rev./min
- 6 balancing threads M6

Scope of delivery

- incl. 6 screws for radial adjustment
- incl. 6 clamping screws
- incl. threaded pins
- order pull studs separately
- SK50/BT holder on request

[illegible]

Module 6x6 shrink fit chuck flange

Product information

- for the highly accurate radial and axial alignment on alignment adaptors or machine spindles
- cooling lubricant without loss and flow-disruption thanks to the use of an intermediate tube
- balancing quality G6.3 / 15,000 rev./min
- for tool shank tolerance h6
- with axial damping screw for optimal concentricity

Scope of delivery

- incl. adjustment screw with axial force
- damping Guh. no. 4941
- incl. 6 angular alignment sets Guhring no. 4715
- incl. 6 clamping screws
- order intermediate tube Guhring no. 4716 separately
- further dimensions on request

Clamping devices

Module 6x6 HPC clamping chuck flange

Product information

- for the highly accurate radial and axial alignment on alignment adaptors or machine spindles
- cooling lubricant without loss and flow-disruption thanks to the use of an intermediate tube
- highest concentricity, clamping force and rigidity thanks to mech. tension gearing
- suitable for internal cooling up to 80 bar
- positive damping characteristics
- for tool shank tolerance h6

Scope of delivery

- incl. hexagon chuck key Guhring no. 4912
- incl. 6 angular alignment sets Guhring no. 4715
- incl. 6 clamping screws
- order intermediate tube Guhring no. 4716 separately
- order clamping sleeves Guhring nos. 4302, 4235, 4236, 4237 separately

Length adjustment screw for conventional cooling

Product information

- To adapt MQL tool holders to meet the requirements of conventional wet machining. For plain end shanks. The height of screw head compensates the height of MQL taper

- for MQL HSK-A shrink fit and hydraulic chucks
- for use with shank according to DIN 6535 with plain shank end for conventional cooling
- with the patented face orientated O ring axial force damping is provided which prevents concentricity errors.

Floating holder for perfect HPC reaming

For the fine machining of holes the matching of pilot hole with the tool axis is a pre-requisite for the perfect functioning of the reamer. Floating holders serve to compensate the lateral off-set between tool and pilot hole. This off-set is usually created by machining with multiple clamping operations, cycle and positioning errors during tool and workpiece changes as well as by alignment errors on turning machines. As our floating holders have been designed for high-speed reaming operations, we consciously dispense of angle compensation. This improves the clamping rigidity. When the radial play is excessive upon entry into the pilot hole the reamer is subjected to high stresses. Crumbling of the edges is the consequence. Limited radial play on our floating holders compensates for any possible vibration even at high speeds.

Coolant ducts integrated in the floating holder ensure the reamer is optimally supplied with cooling lubricant. Longer hole tolerance compliancy and tool life are the result. Higher economic efficiency thanks to cost and time saving is guaranteed.

When a high precision hole position is required, we recommend a pilot with 1 - or 2-flute fineboring tools see chapter „pilot tools“.

Floating holders with side lock holder

Product information

- straight shank d3 with whistle notch flat
- suitable for conventional and high performance multi-fluted reamers, because of no angle compensation
- central coolant supply max. 80 bar
- drive flat on tool shank necessary
- for tool shank tolerance h6

Scope of delivery

- for other shank Ø order reduction sleeves Guhring no. 4095 separately
- order hexagon chuck key Guhring no. 4912 separately
- further sizes with differing radial play are available on request

Collets ER metallic sealed

Product information

- DIN ISO 15488
- for application without sealing washer
- concentricity error max. 6 µm
- for high-performance tools with internal cooling e.g. HR 500 reamers
- ER-DM collets with restricted clamping range

HSS, HSS-E and carbide countersinks

EW 100 G de-burring fork

Advantages

- cost-efficient, as costly and time-consuming manual re-working is not necessary.
- universal tooling for milling, turning and robotic applications. The range of 0.25 mm enables the application of our de-burring fork in holes with large tolerances. Reducing set-up time and cost!
- increased production. De-burring fork EW 100 G de-burrs automatically with one set-up and short cycle times.

Operation

Application examples

1st example

Workpiece with cross-hole

Please note when machining workpieces with cross-holes:

- the diameter of the cross-hole must be maximal 35% of the central hole
- the diameter of the cross-hole must be 40% larger than the cutting length l_4

2nd example

Workpiece with multi-interrupted cut

Step by step:

The automatically internal and external de-burring with de-burring fork EW 100 G is an easy and cost saving alternative to common, extensive manual operations. Just one tool is required for all machining steps.

Universal application:

The new ex-stock de-burring fork machines workpieces with one cross-hole as well as workpieces with multi-interrupted cut and produces high quality de-burred faces and ends of the hole.

De-burring fork cutting parameters

Ø range (mm)	v_c m/min	f_u (mm)
< Ø 4	8 - 10	0.1 - 0.2
Ø 4 - < Ø 6	10 - 14	0.1 - 0.2
6 - Ø 8	14 - 20	0.1 - 0.2

Important:

Please note that the cutting parameters are recommendations. They can be adjusted up or down.

EW 100 VR front/back de-burrer

Guhring's solid carbide EW 100 VR front/back de-burrer with TiAlN-coating as a standard tool enables de-burring as well as chamfering of hole entry and exit with a 90° angle. EW 100 VR possesses a milling head with a

front and back cutting region. To de-burr or chamfer the tool performs a circular milling movement along the hole edge or contour.

GUHRING

Tools with bold feed column no. are preferred choice.

For blind holes with close diameter tolerances choose straight-fluted reamers.

To select the optimal tool and the recommended machining parameters for your application, please also use the electronic version of the GuehringNavigator on the internet: www.guehring.de.

Coolant pressure

Coolant pressure - cutting speed
valid for standard dimensions.
Preconditions: sufficient capacity of coolant pump

Adapted cutting speed, an appropriate feed rate and good cooling and lubricating agents should always be a top priority for reaming operations. A further point to be considered is that the reamer always follows the direction of the pre-drilled hole. An exception is the machine bottoming reamer or a very small reamer. Consequently reamers do not correct alignment errors of pre-drilled holes. Errors between the spindle axis and the axis of a pre-drilled hole can be adjusted with the aid of floating holders. The following fault finding chart will be found useful in tracing the cause of some common reaming problems.

Wording:

<i>Desired dim.</i>	Required finish dimension of bore hole, defined as max./min. dimension of tolerance zone
<i>Reaming dim.</i>	the finish dimension reached in fact
<i>„Bore hole“</i>	The reached bore hole after reaming

1

Holes too large

- Tool diameter too large
- Cutting speed too high
- Concentricity error of machine spindle
- Bevel lead of tool too short/uneven
- Cutting edge build up due to wrong cutting speeds oder schlechte Schmierung
- Lubricating agent unsuitable, holes too large due to lubrication

2

Holes too small

- Reamer blunt. Does not cut, scrapes
- Cutting speed too low
- Component is thin-walled, springs back
- Insufficient stock removal allowance, tool seizes in hole
- Hole is not round due to distortion

3

Conical hole malformation

- Tool knocks in spindle
- Bevel lead incorrect
- Axis shifting between tool and pre-drilled hole. Application of floating holders
- Pre-machining inaccurate

4

Unsatisfactory surface finish

- Cutting speed too low
- No/insufficient lubrication. Cutting edge build-up.
- Tool damaged, i. e. broken cutting edge
- Material has a tendency to cause build up on cutting edges.
- Concentricity bevel lead incorrect
- Chip evacuation restricted

5

Misalignment of hole

- Pre-drilled hole misaligned
- Concentricity bevel lead incorrect
- Apply floating holder if necessary
- If necessary pilot drill to correct pre-drilled position

6

Hole has chatter marks

- Feed too low
- Cutting edge build-up
- Grease content in coolant too low
- Circular lands too small
- Stock removal allowance insufficient
- Tool incorrectly clamped in tool holder
- Machine spindle not concentric

7

Reamer seizes and breaks

- Position to pilot hole incorrect
- Back taper incorrect
- Circular lands too wide
- Pre-drilled hole is too small
- Bevel lead blunt/ground unevenly
- Feed rate too high
- Chip congestion – increase feed rate to produce shorter chips

8

Feed scoring marks in hole

- Cutting speed too low
- Worn cutting edges
- Crumbling on cutting edges
- Build up on cutting edges
- Position to pilot hole incorrect
- Insufficient lubrication

General remarks for the determination of manufacturing tolerances for reamers

The manufacturing tolerances to DIN 1420 are allocated to certain tolerance zones of the holes to be reamed. Generally they ensure the positioning of reamed holes within the relevant tolerance zone as well as the most economical use of the reamer.

It must, however, be taken into account that the size of the reamed hole depends, in addition to the manufacturing tolerance of the reamer, on various other factors, such as angles of cutting edges; bevel lead of reamer; clamping of the workpiece; the tool holder; condition of the machine; the coolant and on the material of the workpiece. Therefore, from time to time other manufacturing tolerances than IT7 (H7) might prove more advantageous.

However, in the interest of economic production and storage, it is recommended that non-standard manufacturing tolerances are used only in exceptional cases.

For determining the manufacturing tolerances the following well-proven *basic rules* were stipulated:

Determination of perm. max. and min. sizes of reamers

The largest permitted reamer diameter ranges at about 15% of the approximate hole tolerance (0.15 IT) below the permissible maximum diameter of the hole (see fig.), whereby the value 0.15 IT will be rounded off to the next higher integer or half μm -value, so that even μm values are derived for $d_{1\text{max}}$. The permissible smallest reamer diameter $d_{1\text{min}}$ ranges at about 35% of the approximate hole tolerance (0.35 IT) below the permissible maximum diameter $d_{1\text{max}}$ (ex. 1).

Simplified determination of permissible max. and min. reamer dimensions

In order to facilitate calculations, the table on page 15 indicates the upper and lower tolerance limits on the nominal diameter d_1 for the most common "H" tolerance zones. With the aid of these tolerance limits the permissible maximum and minimum reamer dimensions can be calculated (ex. 2).

Example 1

nominal diameter d_1	= 20.000 mm
maximum diameter of the hole	= 20.021 mm
hole tolerance (IT 7)	= 0.021 mm
15% of the hole tolerance (0.15 IT 7)	= 0.0031 mm
	≈ 0.004 mm
maximum reamer diameter:	
$d_{1\text{max}} = 20.021 - 0.004$	= <u>20.017 mm</u>
manufacturing tolerance of reamer:	
35% of the hole tolerance (0.35 IT 7)	= 0.0073 mm
	≈ 0.008 mm

minimum reamer diameter:

$$d_{1\text{min}} = d_{1\text{max}} - 0,35 \text{ IT } 7$$

$$= 20.017 - 0.008 = \underline{20.009 \text{ mm}}$$

Example 2

nominal diameter d_1	= 20.000 mm
upper tol limit (s. table p. 70) + 17 μm	= 0.017 mm
lower tol. limit (s. table p. 70) + 9 μm	= 0.009 mm
i. e.: $d_{1\text{max}} = 20.000 + 0.017$	= <u>20.017 mm</u>
$d_{1\text{min}} = 20.000 + 0.009$	= 20.009 mm

Simplified calculation of the permissible maximum and minimum dimensions for reamers

Example: Hole tolerance zone $\varnothing 20$ H7/nom. dimension d_1 of reamer 20 mm

Designation

For the designation of reamers the ISO abbreviation for the tolerance zone of the hole is indicated after the nominal diameter. Designation of a reamer with nominal diameter $d_1 = 20$ mm, for hole tolerance H 7:

reamer 20 H 7 DIN ...
(" ... ": for DIN no. indication
of appropriate reamer)

In special cases, reamers are ordered with maximum and minimum dimensions deviating from this standard, the ISO abbreviation for the hole tolerance zone must be replaced

by the upper and lower tolerance limit of the reamer in μm ,
e.g. for a reamer with a nominal diameter $d_1 = 20$ mm, upper
tolerance limit = + (p) 25 μm and lower tolerance limit
= + (p) 15 μm :

reamer 20 p 25 p 15 DIN ...

The designation shows a 'p' instead of the plus and an 'm' instead of the minus sign, because »+« and »-« cannot be written on all machines, particularly not on data processing machines.

Tolerance position

Conversion ratio to DIN 47

Reading example: 1

When comparing the average roughness index $R_a = 0.4 \mu\text{m}$ to the average roughness R_z we achieve a value of $R_z = 1.6 \mu\text{m}$.

Reading example: 2

When comparing the average roughness $R_z = 25 \mu\text{m}$ to the average roughness index R_a we achieve a value of $R_a = 2 \mu\text{m}$.

Achievable surface quality for reaming operations

achievable

limited achievability

The reamer is the most commonly used tool for the production of holes true to form and tolerance with high surface quality. The latter meets the requirement of 'finishing' or 'fine finishing' i.e. from approximately $Ra\ 0.2$ to $6.5\ \mu m$ according to the scales laid down in DIN 4766. However, finishes to $Ra = 0.5\ \mu m$ can be regarded as satisfactory. Generally, the achievable tolerance ranks at IT 7. In special cases IT 6 or even IT 5 are possible, provided that the reamer is appropriately ground and all other operating conditions meet the high specifications.

In preparation for the reaming process, holes have to be pre-drilled and normally core drilled (fig. 1). Pre-drilled holes produced with gun drills, are due to their highly compressed surface, not particularly suitable for reaming. Moreover, holes produced with gun drills show generally excellent tolerances on fit and surface qualities, so that additional fine finishing is usually not required. Should any further information on our gun drills be needed, please do not hesitate to contact us.

Which reamer for which purpose?

With regard to their application we differentiate between:

- hand reamers
- machine reamers

Hand reamers

Hand reamers are turned in the hole by means of a tap wrench which is mounted on the square. The feeding action is produced manually. Because of the low cutting rates these tools are made of HSS. To ensure a proper guidance in the hole the taper lead length of hand reamers is made considerably longer than that of machine reamers. Hand reamers are available for both cylindrical and tapered holes.

Hand reamers to DIN 859 may be adjusted within the elasticity tolerance range of hardened HSS. This corresponds in practice to 1% of the diameter, i.e. for example 0.1 mm on a reamer with 10 mm diameter. In the fully expanded condition these tools are not very resistant to breakage and must therefore be protected against impact. They should be stored with the tension released.

Expanding reamers can be adjusted over a much larger range, even up to a few millimeters! For accuracy reasons setting must be carried out with a ring gauge.

A basic rule for reaming by hand: turn the tool only in the cutting direction, i.e. never reverse the tool contrary to standard practice in thread cutting. Cutting edges will become immediately blunt if the reamer is turned back.

Fig. 2: taper hand reamer

Fig. 3: adjustable hand reamer

Fig. 4: expanding hand reamer with blades

Machine reamers

Machine reamers are - as the name implies - exclusively designed for use on machines and differ with regard to the type of tool material. Due to the possibility of higher cutting values, these tools are available in HSS-E, solid carbide or carbide-tipped (fig. 5). The tool material should be selected in accordance with the material to be machined.

Fig. 5: carbide-tipped machine reamer

Carbide reamers offer the following advantages:

- Higher cutting speeds and feed rates.
- Most economic machining of materials of over 1200 mm² tensile strength.
- The tool life is much higher than that of HSS-E reamers.

Reamers with special form

Reamers with special form and to special tolerances have recently become more and more common place. Their manufacture requires a great deal of know-how as well as the most modern and sophisticated tooling. We have all the machines and the knowledge to produce even the most complicated tools very economically. Leave the machining problems to us. To meet and overcome them is the daily task of our engineers. They are ready to assist you at all times, to find the best possible solution and, if necessary, to arrange for an obligation-free demonstration of our tools on your own machines.

A further distinctive feature of hand and machine reamers is the geometry of the cutting section, standardised under the following headings:

- straight-fluted reamers
- LH spiral reamers
- reamers with quick spiral (45°) left-hand flutes

Tools with right-hand spiral flutes are only applied in special cases. They produce, as do twist drills, a chip flow up the flutes, which often results in an unsatisfactory surface finish quality.

Reamers with straight flutes are suitable for the machining of blind holes. Here again the absence of chip space at the bottom of the hole means that swarf must be evacuated up the reamer flutes. For all other machining tasks, and particularly for interrupted holes (e.g. holes with keyways, intersecting holes and the like), reamers with left-hand spiral flutes are much more suitable. Chip removal is always in the direction of the feed and for this reason this flute geometry is used almost exclusively for through holes. Their application in blind holes is limited to tasks where reaming to the full depth is not required, so that sufficient space for the chip volume created is available.

Fig. 6: machine roughing reamer

Fig. 7: machine bottoming reamer

The 45° LH quick spiral reamer (fig. 6) has been well tried and tested in long-chipping materials. For absolutely straight and precisely located deep holes we recommend our machine bottoming reamers (fig. 7). Their bevel lead is face-cutting, i.e., they do not cut in conformity with the pre-drilled hole, but correct it truly to size. Machine bottoming reamers should always be applied with bushings.

Fig. 8: stepped carbide-tipped machine reamer

Accuracy in surface quality and form is tremendously improved by dividing the machining process into rough and finishing reaming. Stepped machine reamers (fig. 8) perform these two operations in one pass.

Badly worn taper pin reamers can be salvaged by resharpening of taper and reduction of circular land width.

Storage of reamers

Reamers are finishing tools and therefore very vulnerable. To avoid damage, individual storage and transport in our plastic sleeves is recommended. Tools reward careful treatment by producing excellent results and giving much higher operational life.

Blind hole or through hole

Straight-fluted reamers are generally applied in blind holes as they, due to their cutting edge geometry, evacuate the chips from the hole against the direction of the feed. Spiral reamers are preferred for the application in through holes because the spiral evacuates the chips from the hole in direction of the feed.

Interrupted holes

Spiral reamers are preferred for the application in interrupted holes because the cutting edge geometry, in comparison to straight-fluted tools, possesses a lesser tendency of grabbing on the oblique hole. If the oblique hole is $> 0.25 \times D$, spiral reamers can also be applied in blind holes.

Stock removal allowance of the pre-drilled hole

In the event of the stock removal allowance of the pre-drilled hole exceeding the standard stock removal allowance (see table „Recommended stock allowance“ on page 15), a quick spiral reamer or a machine bridge reamer should be applied. It is possible to machine a considerably larger stock removal allowance with these tools, however, they should not be applied in blind holes due to the bevel lead length and the spiral angle.

Expanding reamers

Expanding reamers can only be expanded. Subsequently, if the resulting measurement is too large it is not possible to turn the screw back as the pretension of the tool would be lost. In most cases this leads to tool breakage. If the pre-tension has been taken from the tool, it requires re-adjusting and re-grinding.

Positional accuracy of the hole

A machine bottoming reamer often provides the best solution when optimal positional accuracy is required, thanks to its special chamfer lead the 'wander' of the tool is minimal. In addition, machine bottoming reamers are often applied when the pre-drilled hole and the reamer are not on the same axis (slight misalignment).

Schematic depiction of expanding and of risk of tool breakage when re-turning set screw (excessive depiction)

Carbide reamer designs

Our carbide grades are applied in the following reamer types:

- Solid carbide NC machine reamers:
Solid carbide
- Carbide machine reamers:
≤ Ø 9.50 mm solid carbide
> Ø 9.50 mm carbide tipped
- Carbide expanding machine reamers:
Carbide tipped

Expanding Reamers Adjustment range

Expanding reamers can be adjusted by the following values according to the diameter range:

- ≥ Ø 12 mm by approx. 0.015 mm
- ≥ Ø 17 mm by approx. 0.020 mm
- ≥ Ø 24 mm by approx. 0.025 mm
- ≥ Ø 32 mm by approx. 0.030 mm

Attention:

Only expand reamer! Because of risk of breakage the pre-tension should never be relieved by turning the set screw anti-clockwise!

Expanding reamers Adjustment range

Expanding reamers have an adjustment range of approx. 0.03 mm via a tapered adjustment screw.

Adjustable hand reamers Adjustment range

Adjustable hand reamers are ground to nominal size and not for holes with tolerance zone H7. The adjustment range is 1/100 of the nominal diameter, i.e. for Ø 10.00 mm approximately 0.1 mm. From Ø 6.50 mm adjustment is via lock nut.

Shell reamers Taper bore

Shell reamers to DIN 219 have a taper bore with a taper 1:30 and a driving slot to DIN 138.

Definitions, dimensions and angles

Reamers

Counterbores

Countersinks

α_o = clearance angle
 α_p = clearance angle of minor cutting edge
 b_α = circular land width
 γ_o = orthogonal rake angle
 γ_f = helix angle
 γ_p = back rake angle of minor cutting edge

χ_r = face setting angle
 P_o = tool orthogonal plane
 P_f = assumed operating plane
 P_p = tool back plane
 P_r = tool reference plane
 P_s = tool cutting edge plane

PRODUCT NO. INDEX
